

Table 20. Effect of method of application of Ammonium sulfate  
on the yield of paddy rice (1940)<sup>a</sup>

Plot	Method of Application of Ammonium Sulfate	Yield (grams)	Total Nitrogen (N) in head and straw (grams)	Percent of Applied Nitrogen (N) Assimilated by rice crop
		Head	Straw	
A <sub>1</sub>	In surface water	196.0	294.9	4.165
A <sub>2</sub>	In surface water, then mixed with soil	237.4	327.5	4.733
A <sub>3</sub>	Mixed with soil after surface water was drained	224.5	344.2	5.546
A <sub>4</sub>	In inner soil layer, 3-6 cm depth	242.4	370.0	6.062
A <sub>5</sub>	None	90.8	106.0	1.600
B <sub>1</sub>	In surface water	227.5	300.2	4.829
B <sub>2</sub>	In surface water, then mixed with soil	239.2	319.6	4.896
B <sub>3</sub>	Mixed with soil after surface water was drained	233.4	324.1	5.219
B <sub>4</sub>	In inner soil layer, 3-6 cm depth	246.0	336.5	5.547
B <sub>5</sub>	None	62.3	72.8	1.241

<sup>a</sup> Experiment details: Soils for plots A<sub>1</sub>-A<sub>5</sub> were in lysimeter tanks which were flooded during rice growing season only. Soils for plots B<sub>1</sub>-B<sub>5</sub> were in lysimeter tanks which were flooded throughout the year. Both tanks were at Nishigahara Agricultural Experiment Station, Tokyo. Area of each plot was 0.5 square meter. On 24 June 1940, 0.5 g P<sub>2</sub>O<sub>5</sub> and 0.5 g K<sub>2</sub>O as KH<sub>2</sub>PO<sub>4</sub> and K<sub>2</sub>HPO<sub>4</sub>, were applied to each plot. Ammonium sulfate was applied to all plots except the check plot. The rate of application was 0.5 g N per plot. Rice seedling were transplanted on 26 June 1940. Rice crop was harvested on 8 October 1940.

Table 21. Composition of Degraded Paddy Rice Soils and Normal Paddy Rice Soils (1942)

Soil <sup>a</sup>	Depth cm	Free Fe <sub>2</sub> O <sub>3</sub> b (Percent)	Fe <sub>2</sub> O <sub>3</sub> soluble in hot conc.HCl (percent)	P <sub>2</sub> O <sub>5</sub> soluble in hot conc.HCl (percent)	Total N (percent)	Total C (Percent)	Produc- tion of NH <sub>4</sub> -N after Air-Dry- ing (mg N/100 g dry soil) <sup>c</sup>	Presence of H <sub>2</sub> S in reduced layers

ND: No data available.

- a Soil A - Highly degraded paddy soil. Gunge, Kagawa Prefecture.
- Soil B - Slightly degraded paddy soil. Gunge, Kagawa Prefecture.
- Soil C - Normal paddy soil. Agricultural Experiment Station, Konosu, Saitama Prefecture.

b Determined by Truog's method 9.

c Air-Dried samples were incubated at 30° C for 30 days. NH<sub>4</sub>-N produced was determined.

Table 22. Distribution of active manganese and free ferric oxide in profiles of degraded paddy rice soils and normal paddy rice soils (1945)

Soil <sup>a</sup>	Depth cm	Manganese content (mg Mn per 100 g dry soil)				Presence of $MnO_2$ <sup>d</sup>	Free $Fe_2O_3$ <sup>e</sup> (percent)
		Manganese Soluble in hot conc HCl		Active $Mn^{++}$	Manganese <sup>c</sup> $Mn^{+++}$

ND: Not determined

a/ Experimental details: Field experiments were conducted at the Agricultural Experiment Station Konosu, Saitama Prefecture, in 1940.

Compost was applied on 20 June one day before second harrowing after the fields were flooded. NP, and K were applied 28 June before third harrowing.

Rice seedlings were transplanted on 30 June.

b/ Methods used to dry soil: None field was plowed on 28 May 1940 and was flooded on 31 May 1940.

Slightly-dried-field was plowed on 1 May 1940 and was flooded on 31 May 1940.

Well-dried-field was plowed on 1 May 1940, covered during rainy days and at night and was flooded on 31 May 1940.
